Output

1. DLT evaluation

The general suitability evaluation of DLT for this use case states: DLT suitable

More subjective fitting criteria indicate for DLT: Likely use case

2. DLT elicitation

After detailed elicitation of requirements, the following recommendations for most appropriate, also viable and least recommended DLT type are:

- Most appropriate: hybrid DLT
- Also viable: public / hybrid DLT
- Not recommended: private DLT

3. DLT design

After re-evaluating the DLT type in the DLT design stage, the tool concludes the following DLT type as best fit: hybrid / private DLT

The following design patterns are recommended for the use case:

- On-/off-chain connection
  - Off-chain signature pattern
  - Content addressable storage pattern
  - Delegated computation pattern
- Encryption
  - Hash on-chain and raw data in external storage (database or decentralized content addressable storage)

Central backend service

Own full DLT node

3rd party DLT node service

Key management / wallets

3rd party key management service

Central backend service

Companies

Stability / standardization of business logic
